</table>
| **Amlodipine** [arterial dilator] | Tablets: 2.5, 5, 10 mg | PO: 0.625-1.25 mg per cat, q12-24h | • Generally start at lower range and uptitrate dose to desired BP  
• Initial dose is typically q24h  
• Hypotension, RAAS activation, gingival hyperplasia |
| **Aspirin** [NSAID/antithrombotic] | Tablet: 81 mg | PO: 1-2 mg/kg, q24h  
Alternative: PO: ¼ of an 81 mg tablet, per cat, q3 days (or twice a week) | • May cause GI signs especially with higher doses |
| **Atenolol** [beta-blocker] | Tablets: 25, 50, 100 mg | PO: 1.0-2.5 mg/kg, q12h  
Alternative: PO: 6.25-12.5 mg per cat, q12h | • For HR control in CM: The target HR in hospital is ≈160 bpm  
• Initiation should **not** be considered when active CHF is present  
• Cats without CHF can tolerate higher initial and target doses  
• Abrupt discontinuation should be avoided, gradual down titration is recommended  
• Myocardial depression, bradycardia (sinus and AVB), hypotension |
| **Benazepril** [ACEI] | Tablets: 5, 10, 20, 40 mg | PO: 0.25-0.5 mg/kg, q12h or 0.5 mg/kg, q24h | • Generally start at lower range and increase to maximal dose with monitoring of renal function and serum potassium and BP.  
• Contraindications: dehydration, hyponatremia  
• Hyperkalemia, azotemia, acute renal failure |
| **Buprenorphine** [opioid/analgesic] | For injection: 0.3 mg/ml | Parenteral: 5-10µg/kg IV/IM/SC  
PO (buccal mucosa): 0.2-0.3 mls of injectable preparation per cat | • Oral administration at home can be used for emergency treatment of pain associated with acute ATE. |
| **Butorphanol** [opioid/analgesic/anxiolytic] | For injection: 2 mg/ml or 10 mg/ml concentrations | Parenteral: 0.1-0.4 mg/kg, IV/IM/SC | • Effects range from “antianxiety” to heavy sedation depending on dose  
• Can be safely used in dyspneic cats to help reduce stress and facilitate diagnostics  
• Typical dose for anxiolysis in acute heart failure is 0.1-0.2 mg/kg, IM repeated in 30-60 min if needed |
| **Clopidogrel** [thienopyridine-antithrombotic] | Tablet: 75 mg | PO: 18.75 mg per cat, q24h | • No specific monitoring required  
• Superior to aspirin for prevention of a second ATE event  
• Bitterness of preparation may cause ptyalism in some patients |

### CEG Formulary: Cardiac Medications for Cats

**Hydrochlorothiazide**
* [thiazide diuretic]
Tablets: 25, 50 mg
PO: 0.5-2.0 mg/kg, q12-24h

- **Note:** hydrochlorothiazide is typically used as a rescue diuretic when furosemide resistance is encountered (e.g., the recommended maximum daily dose is exceeded).
- A small reduction (≈ 25%) in furosemide dosage may limit adverse effects when hydrochlorothiazide is introduced as a rescue diuretic in chronic heart failure.
- Monitor renal parameters, electrolytes and PCV closely when used with other diuretics.
- Hypovolemia, azotemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, metabolic alkalosis are very common side-effects when used in combination with furosemide.

**Nitroglycerine**
* [vasodilator]
2% paste (Nitrol®, Nitro-Bid®, Nitrostat®): 1 inch = 15 mg
Topical administration: 2-4 mg per cat q6-8h for 1 to 2 days

- **Note:** Delivered dose is affected by perfusion of the application area.
- Apply to hairless/well-perfused skin sites.
- Duration of administration typically 12-24h.
- Hypotension is possible.

**Omega-3 Fatty Acids**
* [nutraceutical, fish oil]
Docosahexaenoic acid (DHA) and eicosapentaenoic (EPA) combined in a fixed-dose capsule (Typically, 1.5:1 or 2:1 EPA:DHA).
Note: most commercial 1 gm (1000 mg) omega 3 capsules contain 180 mg EPA and 120 mg DHA. EPA and DHA are also available in separate capsules.
PO: EPA, 40 mg/kg, daily dosage
PO: DHA 25 mg/kg, daily dosage
PO combination formulation= 1 gm (1000mg) capsule per 5 kg body weight (or per cat) per day

- **Note:** Gel caps or soft pills with 180 mg EPA and 120 DHA are often appropriate size.
- Avoid products with Vitamin A or D (Vitamin E is a safe additive).
- Adverse GI side-effects are possible and can limit tolerance, especially early in therapy.

**Pimobendan**
* [inodilator]
Chewable tablet (Vetmedin®): 1.25, 2.5, 5, 10 mg
Capsules (Vetmedin®, available in some countries outside of the US): 1.25, 2.5, 5.0 mg
PO: 0.625-1.25 mg per cat q12h

- **Note:** Do not reformulate into a suspension.
- Initial dose should be given on an empty stomach if a rapid onset of action is desired.
- Contraindicated in patients with known outflow tract obstruction.
- Potential idiosyncratic side-effects (none consistently reported).

**Sotalol**
* [antiarrhythmic/ beta–blocker]
Tablets: 80, 120, 160, 240 mg
PO: 1-2.5 mg/kg, q12h

- Use with caution and at the lower end of the dosage range in CHF.
- Cats without CHF and or myocardial failure will tolerate higher initial and target doses.
- Do not combine with atenolol, other beta-blockers or diltiazem.
- Myocardial depression, bradyarrhythmias (sinus and AVB), pro-arrhythmia.
### Spironolactone*

*aldosterone receptor blocker, K+ sparing diuretic*

<th>Route</th>
<th>Administration</th>
<th>Notes</th>
</tr>
</thead>
</table>
| Tablets: 25, 50, 100 mg | PO: 1-2 mg/kg, q12-24h | • Negligible to weak diuretic effect: administered for cardioprotective/anti-fibrotic effects  
• Higher dosages may be used for right-sided CHF  
• Risk of hyperkalemia may be exacerbated by co-therapy with an ACEI, especially if furosemide is not also administered  
• Facial excoriations have been reported |

*These drugs are generally available as a suspension or solution from a compounding pharmacy. Consult with a registered pharmacist regarding stability and storage.

### Taurine

*amino acid*

</table>
| Tablets/Caplets/Capsules: 250, 500, 1000 mg Powders of various strengths | PO: 250-500 mg per cat, q12h | • Empirical therapy can be administered in suspected deficiency cases  
• Deficiency can be confirmed prior to supplementation by measuring whole blood/plasma concentrations |

<table>
<thead>
<tr>
<th>Abbreviations used in this table:</th>
</tr>
</thead>
</table>
| ACEI = angiotensin converting enzyme inhibitor  
ATE = arterial thromboembolism  
AVB = atrioventricular block  
BP = blood pressure  
CHF = congestive heart failure  
CM = cardiomyopathy  
CRI = constant rate infusion  
GI = gastrointestinal  
h = hour  
HR = heart rate  
IM = intramuscularly  
IV = intravenously  
PCV = packed cell volume  
PO = per os (by mouth)  
q h = every ___ hours  
RAAS = renin angiotensin aldosterone system  
SC = subcutaneously |

Note: This is a FELINE formulary only; typical dosage ranges are shown; clinicians should be familiar with the pharmacology, indications, contraindications, monitoring and toxicity of any drug prescribed. When wide dosage ranges are shown, the clinician should understand potential needs for up-titration of doses as well as potential for cardiac depression and hypotension in cats with heart failure or impaired ventricular function.

When proprietary names are not indicated, there are usually generic equivalents available.

*These drugs are generally available as a suspension or solution from a compounding pharmacy. Consult with a registered pharmacist regarding stability and storage.

Drugs not associated with an asterisk should not be reformulated or reconstituted without consultation with a registered pharmacist.

With the (possible) exception of nitroglycerine ointment, cardiac medications are ineffective with administered topically.
